INITIAL PROCESS – *Description* -

- ❑ The customer submits a complaint to the company after receiving the package. **Customer Service** analyses the complaint and makes a decision: either to initiate the return process or to escalate the complaint to the Legal Department for slander. In the event of legal action, the return procedure is immediately suspended. If the return is deemed legitimate, the customer receives an email requesting them to ship the product back within 30 days (otherwise, the procedure is terminated and aborted).
- ❑ Once the product is received, technicians evaluate its condition. If it is in good condition, or if it is damaged but the issue originated from production, a notification is sent to the Accounting Department to issue a full 100% refund to the customer. If the product was damaged by the customer, a notification is sent to the Accounting Department to process a partial refund of 85%, or 70% if the product is severely damaged.
- ❑ Simultaneously, the technicians log the product details into the Excel spreadsheet and store it in the warehouse, while the accountant calculates the final refund amount and processes the payment. The process concludes once the customer is notified of the effective refund.

Process

REINTERPRETATION

The process is structured around strict decision-making flows where technical and accounting actions are interdependent:

Step 1

Complaint Receipt & Validation: After receiving the complaint, Customer Service analyzes it and decides on the action to be taken:

- ☐ **Case A (Legitimate):** Initiation of the return procedure. The customer is then notified and has a 30-day window to return the product.
- ☐ **Case B (Abusive / Slanderous):** Immediate suspension of the return flow and transmission of the file to legal counsel for defamation proceedings.

STEP 2

Simultaneous Technical Analysis & Accounting Execution: Once the legitimacy of the claim is established and the product is received, its condition is evaluated and the origin of the failure is verified.

Step 3

Once the analysis is complete, data logging into the system is performed, and the product is stored in the warehouse. In parallel, the Accounting Department is contacted to process the refund according to the following rules:

- ☐ **100% Refund:** If the issue stems from a production defect AND the product is in good condition.
- ☐ **85% Refund:** If the issue is customer-related BUT the product is in good condition.
- ☐ **70% Refund:** If the issue is customer-related AND the product is damaged

The process ends with the notification to the customer

PROBLEM STATEMENT

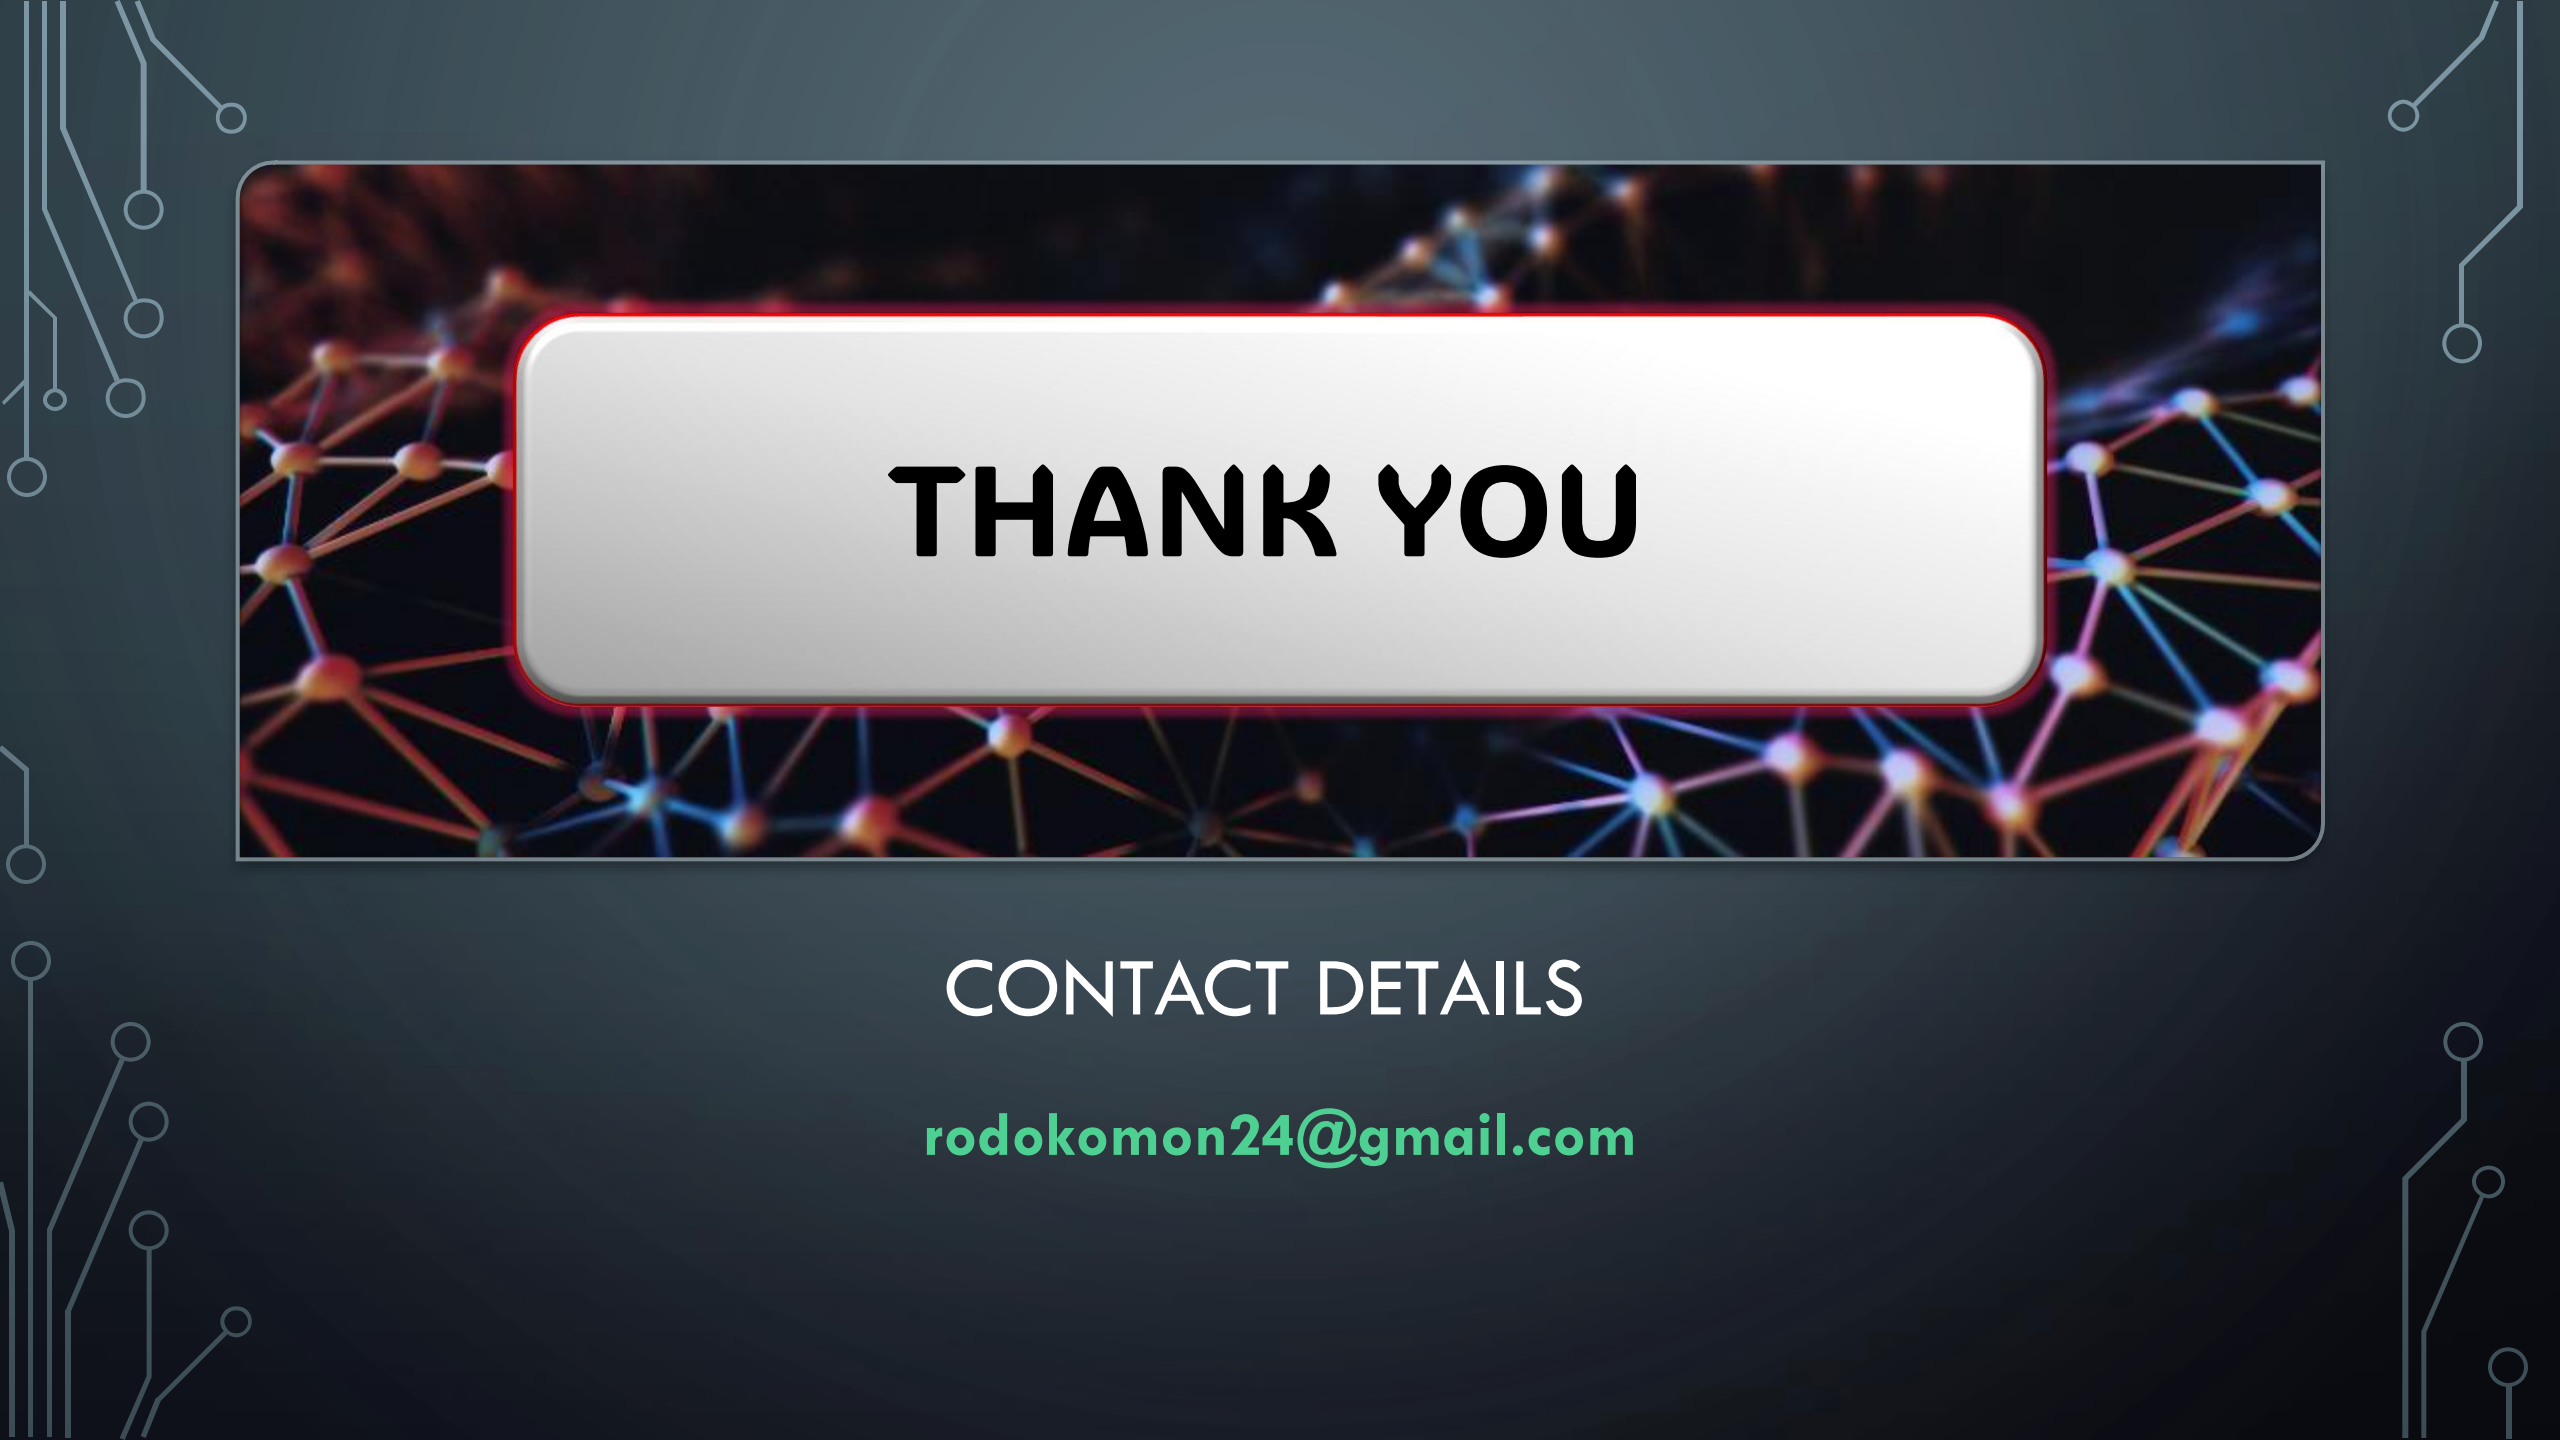

The audit of the current Excel-based system reveals critical flaws related to the synchronization of tasks:

- ❑ **Lack of parallelism:** Currently, the technician fills in his table and the accounting department must then consult this file to make his calculations. This manual "handover" is a source of reading errors and late payments.
- ❑ **Complexity of Business Rules:** The multiplication of reimbursement rates (100%, 85%, 70%) according to the cross-referencing of two variables (Origin vs. State) makes manual entry in Excel extremely risky.
- ❑ **Invisibility of Exceptional Cases:** Cases sent to court (defamation) go off the radar of the standard spreadsheet, creating a break in follow-up between customer service and the legal department.
- ❑ **Time-Out Management:** No alert is generated on D+30, forcing a manual review line by line to identify the files to be aborted.

SOLUTION PROPOSITION

The main solution is the automation of a part of the problem:

- ❑ **Logic Automation:** Replaced manual refund estimations with precise SQL-based logic (**CASE WHEN**) and Excel formulas.
- ❑ **Financial Accuracy:** Developed a calculation engine that automatically applies 70%, 85%, or 100% refund rates based on product condition and issue source.
- ❑ **Time-Fencing:** Integrated a “30-day rule” to automatically flag or abort expired claims, protecting company cash flow.
